EthnoHack 2026

Citeflora

Traditional knowledge.
Traceable evidence.

A research workspace for source-linked plant-use extraction and review

Plant-name ambiguity

“Mint”

A source can preserve a name without identifying a species.

Citeflora keeps that uncertainty visible during review and export.

Possible candidates in the current lexicon

Mentha spicata

Mentha longifolia

Mentha × piperita

Identity requires contextual evidence.

A passage stays attached to every candidate

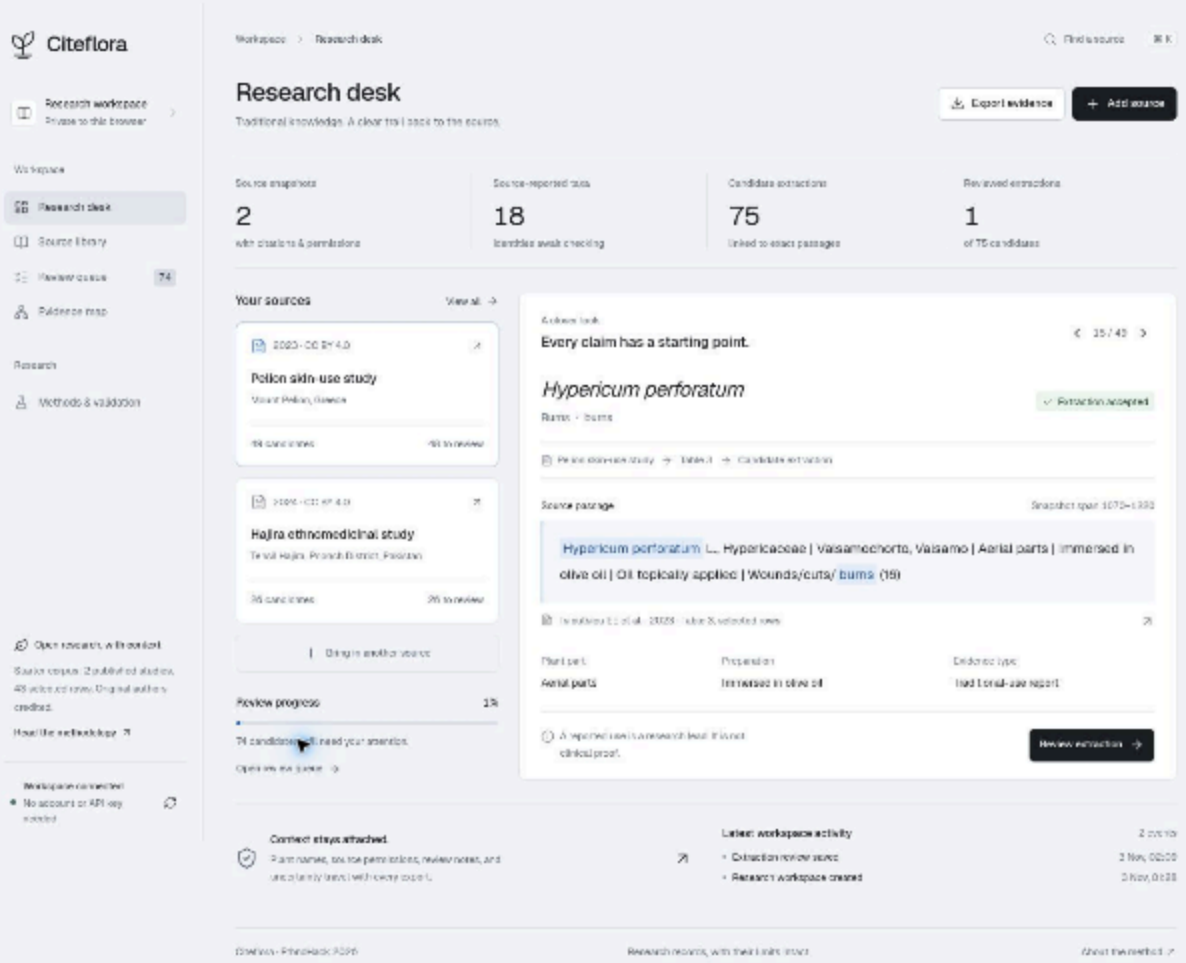

The research desk

Exact source spans

Citations and permissions

Review state and history

Original text remains unchanged.

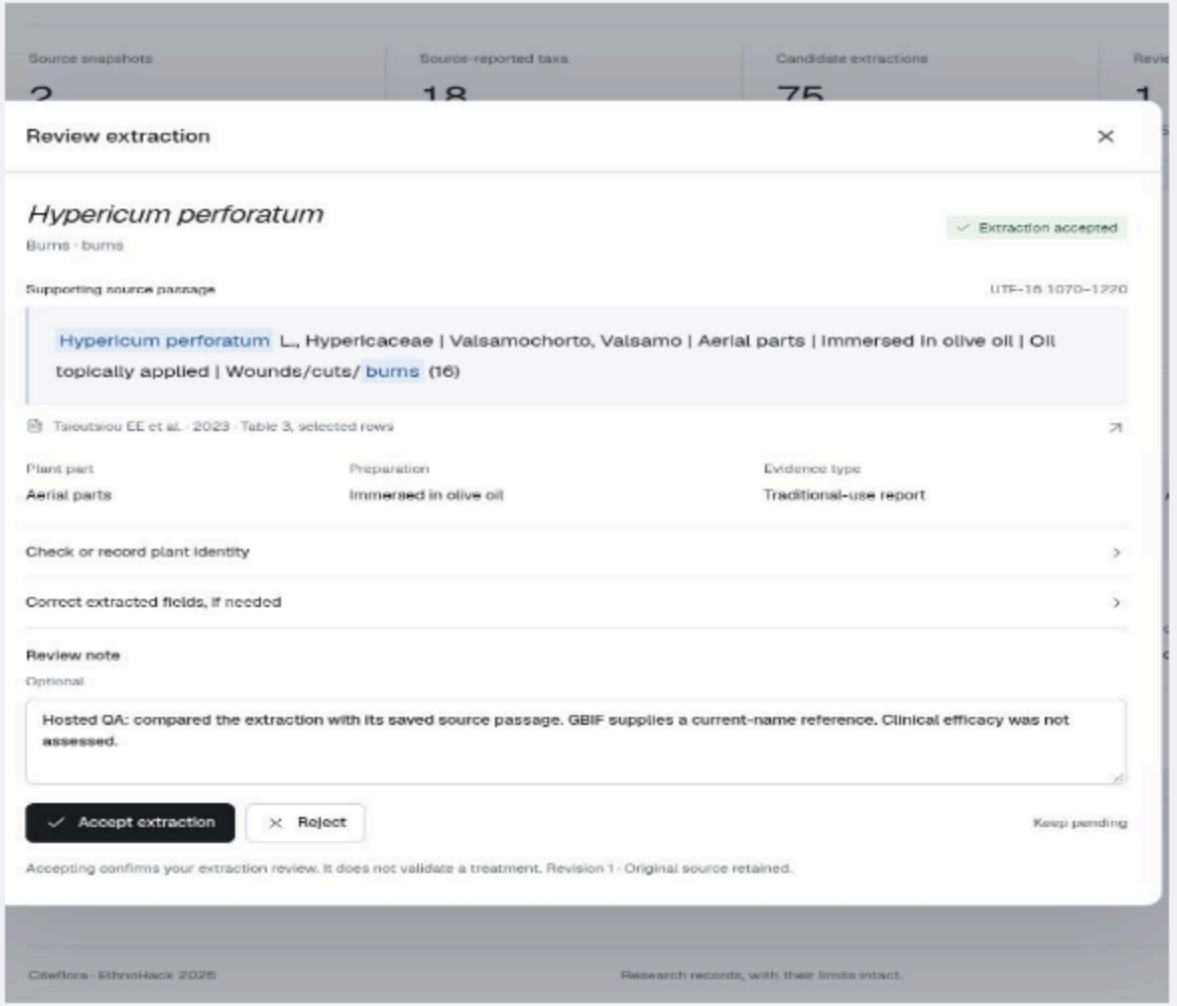

A review records the decision and its basis

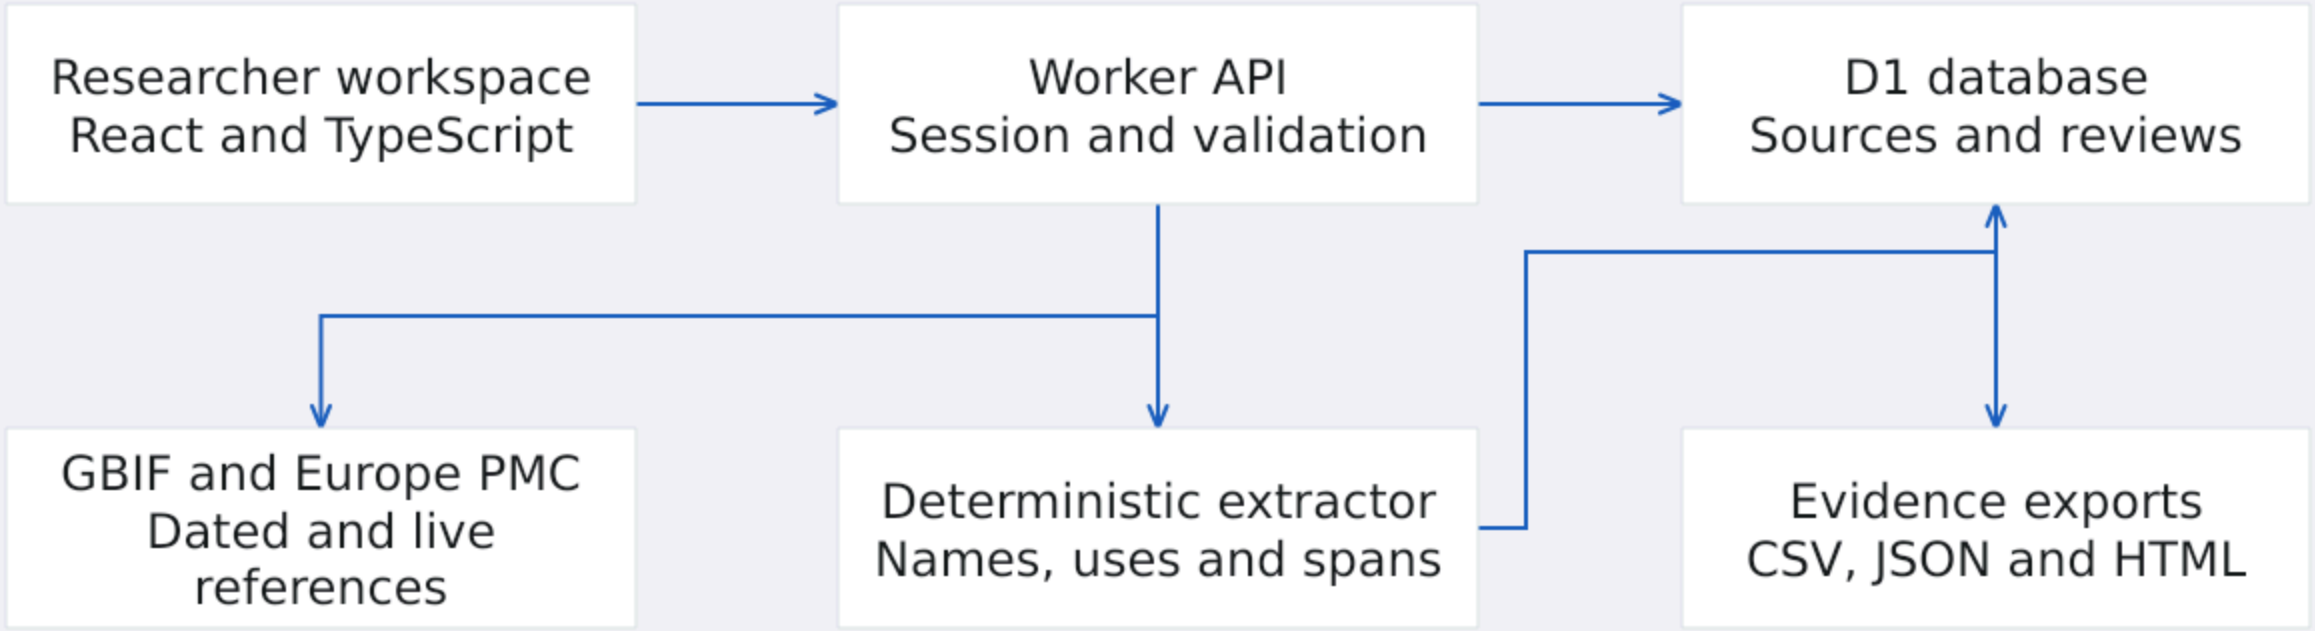

Researchers inspect the quote, record uncertainty, and accept, reject, or keep a record pending.

Optional taxonomy suggestions retain their provider and date.

Acceptance checks the extraction. Clinical validity remains unassessed.

Architecture and evidence flow

Source hashes and review revisions remain available in exports.

A bounded, attributed starter corpus

Published source	Selected rows	Candidates
Pelion skin-use study, 2023	21	49
Hajira study, 2024	22	26
Total	43	75

18 source-reported taxa

75 / 75 exact passage spans

Integrity checks establish traceability. Scientific accuracy still needs independent evaluation.

Verification and current limits

Verified in this build	Current limit
40 regression and API checks pass	Developer-authored fixtures
75 source spans and both digests match	A small two-paper starter corpus
Hosted review survives reload	Browser session, no team accounts

Production dependency scan: 0 known advisories

Four moderate build-tool findings remain. No independent scientific validation.

Next evaluation and access

Next: independent evaluation with ethnobotany and pharmacognosy researchers

Broader language coverage and community-governed permissions will require research partnerships and explicit consent.
